## The Safestrip Bulk Sampling Kit

The Safestrip Bulk Sampling Kit for handling asbestos is cost effective, safe and simple to use. Sampling with the Safestrip Bulk Sampling Kit ensures that airborne fibres are kept to an absolute minimum. The Astrip® wetting

agent leaves a residue of polymers that hold the fibres together; thus the area is left safe. There is no unnecessary handling as the tube containing the sample is sent capped and doubled bagged to the laboratory for analysis.

The Safestrip Bulk Sampling Kit contains everything you need for safe and efficient sampling of friable materials:

The approximate weight of The Safestrip Bulk Sampling Kit is 12kg

**Sample Taking Has Never Been Easier!** \* We reserve the right to alter the contents of the box

Simply pressurise the vessel, to about 2-3 p.s.i./0.2 bar, place a polythene disc over the surface to be injected and push the needle into the lagging. Press the trigger and lock into the open position. After 2-3 minutes the area

will be sufficiently wet to take the sample. The sampling tube can be pushed into the lagging, withdrawn, capped, double bagged and then sent to the laboratory for analysis.
